HEAVY RAIN

Marcus assembles context by hand before 14 weekly founder calls

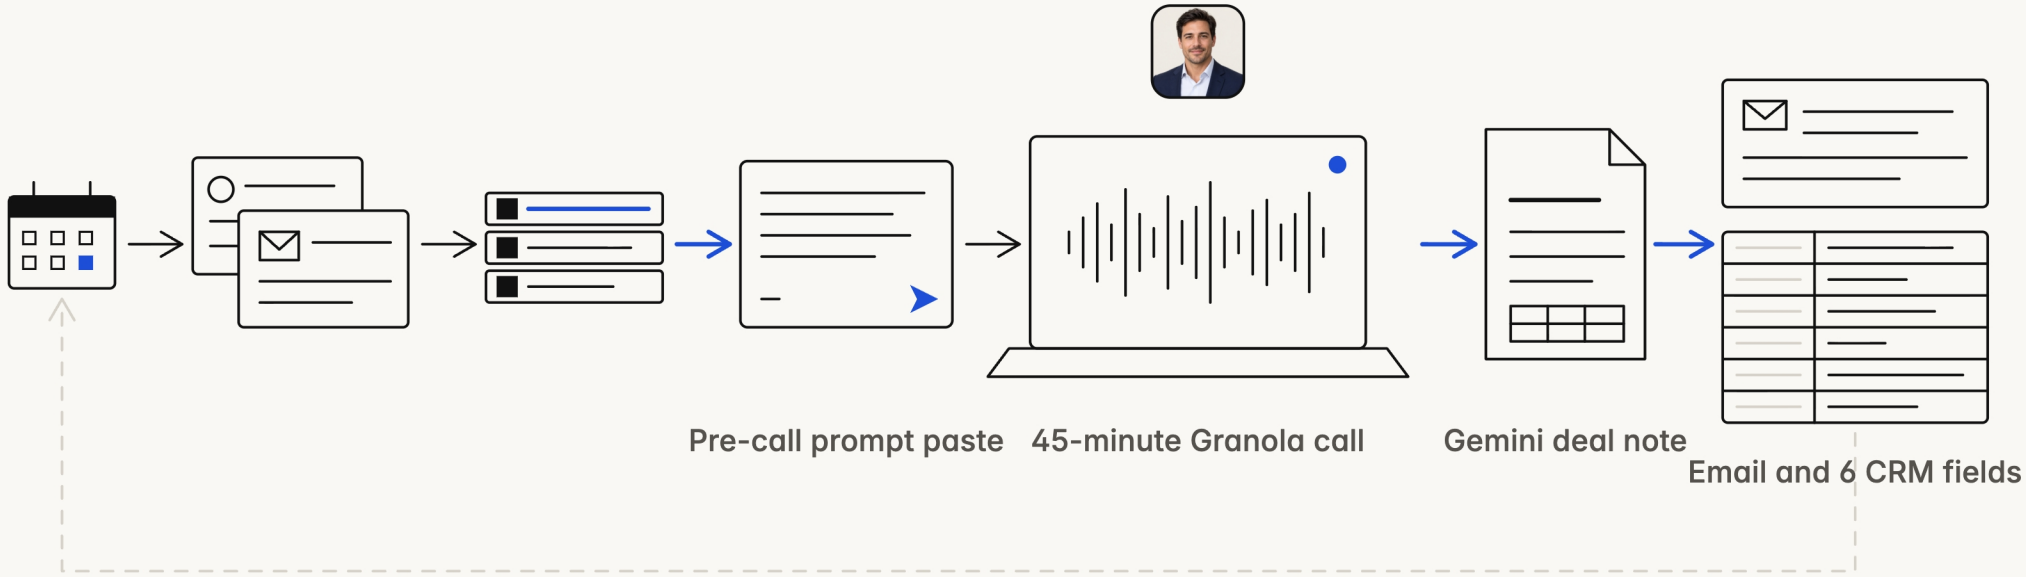

Marcus Vance
VP, Deal Sourcing & Screening
Meridian Crest Capital

> "Run my deal screening skill and give me 5 questions to ask."
>
> Manual pre-call prompt pasted into Claude or Gemini

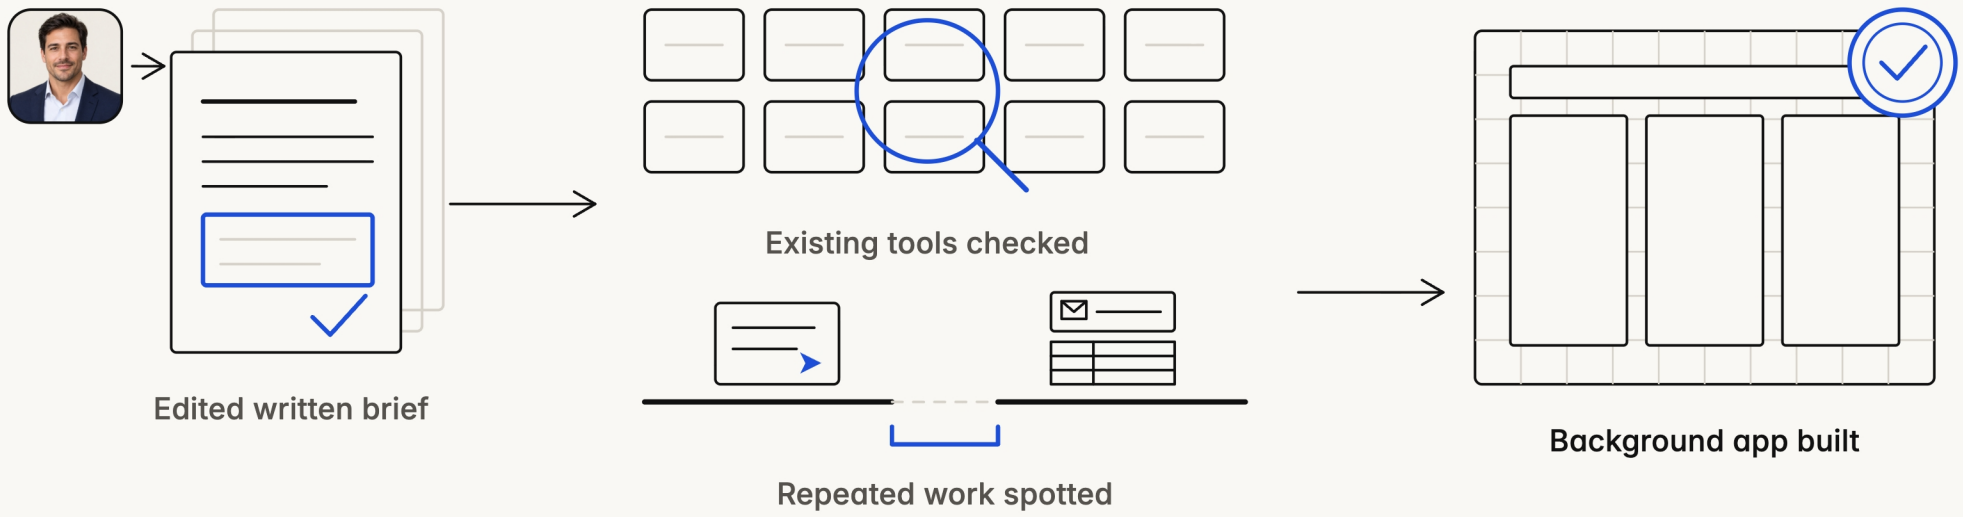

Each founder call takes seven steps across disconnected tools

He pastes the Granola transcript into Gemini and updates six Affinity fields manually.

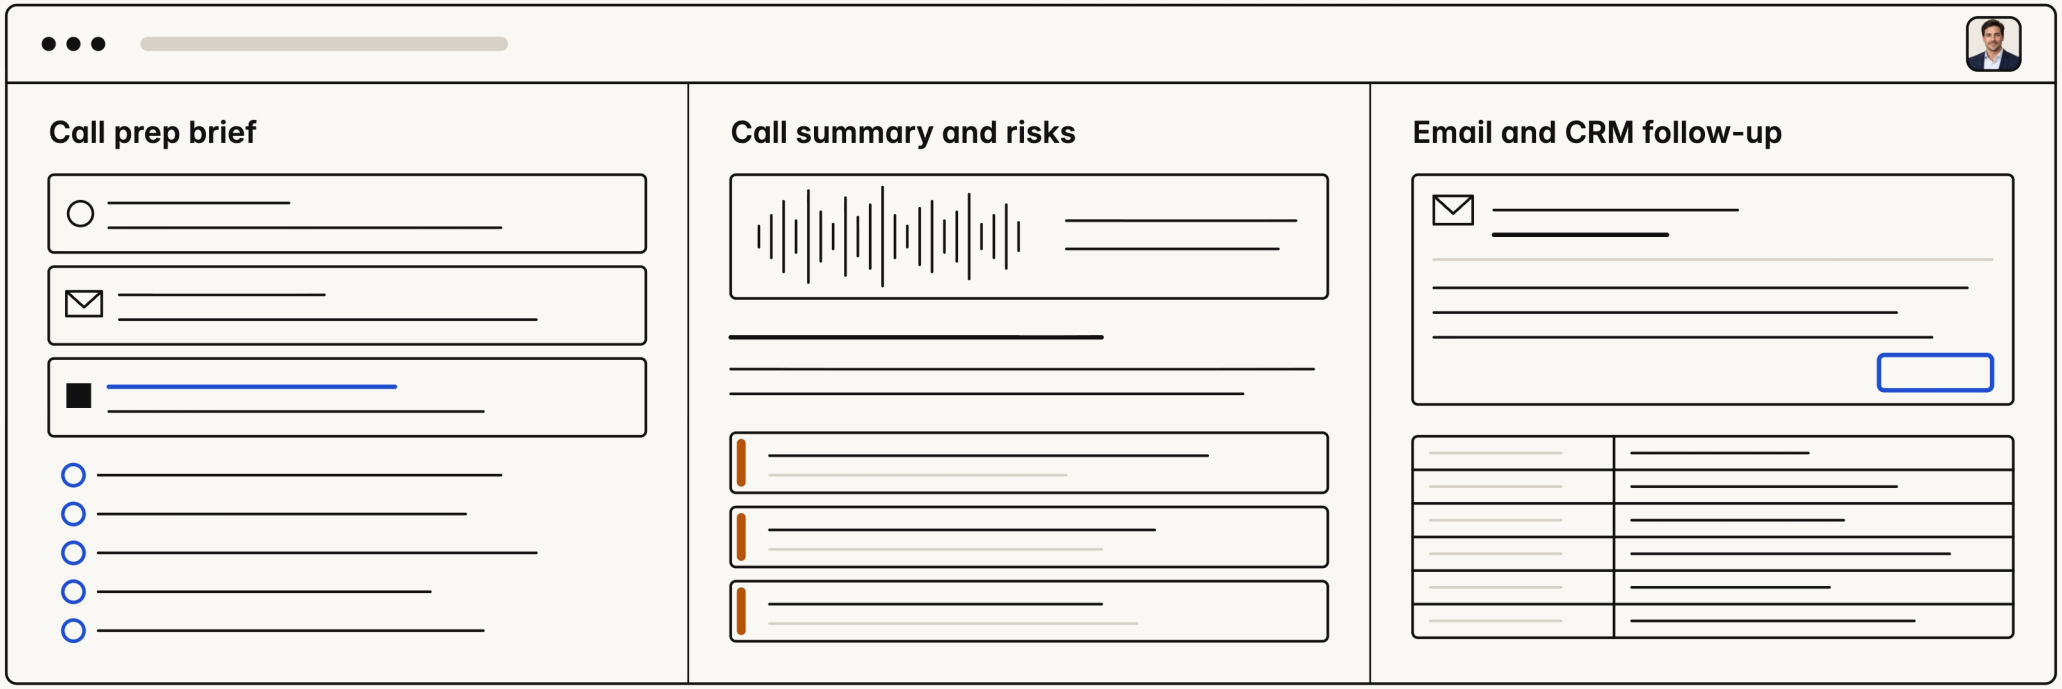

Heavy Rain spots repetitive work and builds an app in the background

As Marcus's personal software engineer, it reviews his edited written brief and builds a working app.

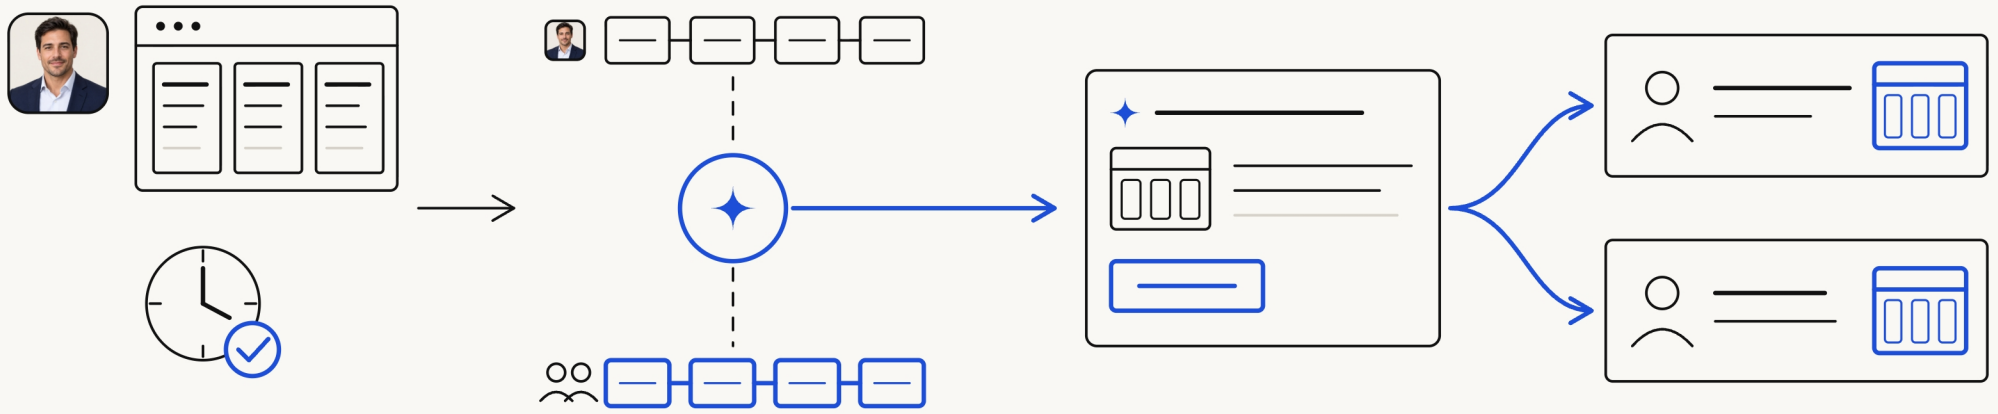

Heavy Rain built DealPulse AutoBrief for call prep, summaries, and follow-up

The platform pairs shared firm UI and approved tools with build requirements for SSO, security, and deployment.

Marcus saves time, and Heavy Rain recommends AutoBrief to teammates

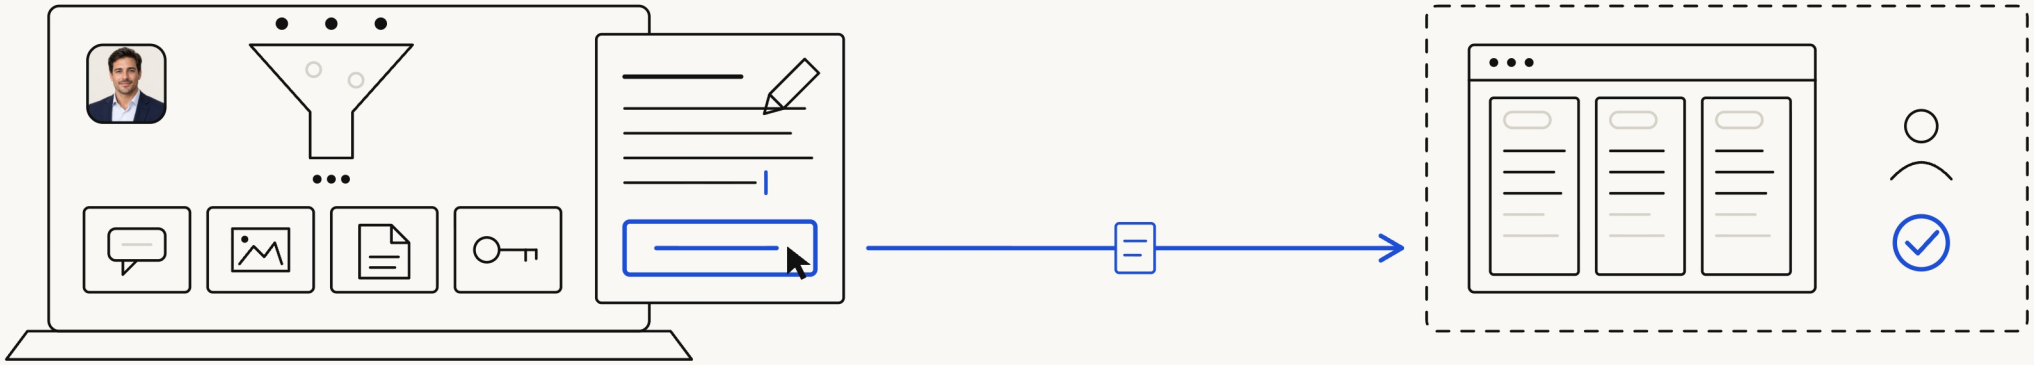

He cuts out repeated copying around every call, and Heavy Rain suggests the app to coworkers with the same workflow.

Open Marcus workflow page

This is not surveillance

Work context stays on Marcus's laptop until he sends a written brief.

Local on the laptop

Personal activity is filtered out. Chats, screenshots, files, and credentials stay in existing tools.

Edit context before transfer

Marcus edits the brief and presses Transfer Context. Only that text leaves.

Hosted sandbox build

Heavy Rain builds on labelled sample data for human review.

It makes no production writes and sends no automatic messages.
